

# Autonomous flying drone for building surveillance

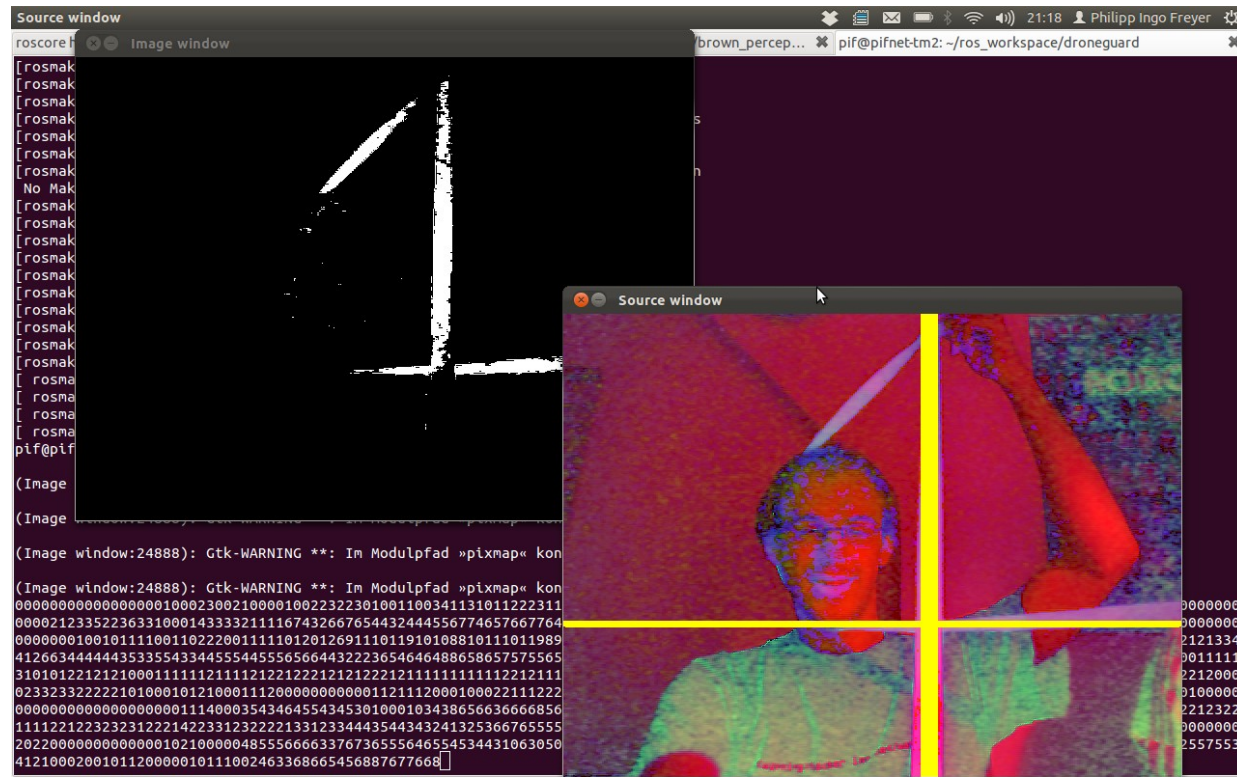

# Topic Motivation

- Use AR drone for building surveillance
- Addition to existing watchmen
- Fly a predefined path through a building
- Videostram of the drone's camera image to the guard-room
- Take pictures of points of interest for security archive
- Learns map of the route for case of occluded waypoints

# Done so far

- Read image stream into OpenCv images
- Find red lines in the image
- Extract vector path from lines
- Concept for Map
- Implemented basic control node
- Testing & Debugging

# Problems, we had

- Team lost a member due to time issues
- Control node had problems finding the correct point on the line to go to
- Some formulas were incorrect
- In bad light, the line was not visible clear enough
  - → Strap a light to the drone

# What can we do?

- Actually follow the line
- Include ar\_recog for marker recognition
- Include marker database for EKF position correction
- ~~Find crossways~~
- ~~Send waypoints out of EKF to Map~~
- ~~Implement battery monitor~~
